Arabidopsis Full Length cDNA Clones Unpublished 2 (bases 1 to 1238) Lam, B.,

Direct Submission

Submitted (03-DEC-2001) Plant Gene Expression Center, 800 Buc Street, Albany, CA 94710, USA

The RIKEN Genomic Sciences Center (GSC) members carried out to collection and clustering of RAFL cDNAs (RAFL cDNA: 'RIKEN Arabidopsis Full-Length CDNA'): Seki,M., Narusaka,M., Ishi Satou,M., Kamiya,A., Sakural,T., Carninci,P., Kawai, J., Hayashizaki,Y. and Shinozaki,K. 800 Buchanan Ishida, J., the

The Salk, Stanford, PGEC (SSP) Consortium members constructed and sequenced the pUNI (ORF) clones using the RAFL cDNAs: Yamada,K., Banh,J., Chang,C.H., Chang,E., Dale,J.M., Goldsmith,A.D., Lee,J.M., Conodera,C.S., Quach,H.L., Tang,C.C., Toriumi,M., Wu,H.C., Yamamura,Y., Yu,G., Yu,S., Bowser,L., Chen,H., Cheuk,R., Jones,T., Karlin-Neumann,G., Kim,C., Lam,B., Lin,J., Meyers,M.C., Miranda,M., Nguyen,M., Palm,C.J., Shinan,P., Southwick,A., Davis,R.W., Ecker,J.R. and Theologis,A.

Yamada, K. (SSP/PGEC) and Seki, M. (RIKEN GSC) contributed equally GSC) and The work as PIs. Theologis, A.

                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a set of peroxidase genes found in plants, especially rice, and their homologues, modified forms and fragments, where the sequences of the peroxidase genes in the set are given in AAH44071 to AAH44091. Also described are: (1) promoters for the control of the gene set; (2) the preparation of cassette vectors using the genes and promoters; (3) analysis of plant characteristics using the peroxidase set by isolating RNA from the plant, binding the RNA to a membrane, mixing with a labelled peroxidase gene set, incubating, and detecting the label signal to show which genes in the set are expressed in the sample plant; and (4) DNA microarrays for peroxidase gene expression in particular rice plants and their component tissues and under different environmental conditions, and modification of rice plants to provide desired specificities of peroxidase gene expression to impart particular characteristics to the plants such as response to bacterial infection by Magnaporthe grisea.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DB:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (CCR), phenylalanine ammonia-lysse (PAL), 4-commanded (ACL), coniferol glucosyl transferase (CGT), coniferon beta-glucosidase (CBG), laccase, peroxidase, ferulate-5-hydroxylase (F5H), alpha-amylase, caffeic acid methyl transferase, caffeoyl CoA methyl transferase, commerate COA ligase, cytochrome P450 LXXIA, diphenol oxidase, flavanol glucosyl transferase, flavenoid hydroxylase, and isoflavone reductase, which are involved in the lignin biosynthetic pathway. The polynucleotides can be used for modulating lignin content, lignin composition and the structure of a plant, especially eucalyptus and pine species, and for modifying the activity of an enzyme involved in lignin content, composition and structure. They can be used for designing probe and primers useful for detecting similar DNA and RNA sequences in any correct and for producing a plant having altered lignin content.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               organism and for PCR amplification. The lignin content can be efficiently modified using the polynucleotides. AAA67908 to AAA68201 and AAB16341 to AAB16449 represent polynucleotide and protein sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            encoding and representing the enzymes cinnamate 4-hydroxylase (C4H), commarate 3-hydroxylase (C3H), phenolase (PNL), O-methyl transferase (OMT), cinnamyl alcohol dehydrogenase (CAD), cinnamyl-CoA reductase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      in the sample plant; and (4) DNA microarrays for peroxidase gene expression analysis. The set of genes are used for the analysis of the pattern of peroxidase gene expression in particular rice plants and their component tissues and under different environmental conditions, and modification of rice plants to provide desired specificities of peroxidase gene expression to impart particular characteristics to the plants such as response to bacterial infection by Magnaporthe grisea.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                plants, especially rice, and their homologues, modified forms and fragments, where the sequences of the peroxidase genes in the set are given in AAH44071 to AAH44091. Also described are: (1) promoters for the control of the gene set; (2) the preparation of cassette vectors using the genes and promoters; (3) analysis of plant characteristics using the peroxidase set by isolating RNA from the plant, binding the RNA to a membrane, mixing with a labelled peroxidase gene set, incubating, and detecting the label signal to show which genes in the set are expressed detecting the label signal to show which genes in the set are expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1158

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         coumerate COA ligase, cytochrome P450 LXXIA, diphenol oxidase, flavanol glucosyl transferase, flavenoid hydroxylase, and isoflavone reductase, which are involved in the lignin biosynthetic pathway. The polynucleotides can be used for modulating lignin content, lignin composition and the structure of a plant, especially eucalyptus and pine species, and for modifying the activity of an enzyme involved in lignin biosynthetic pathway, and for producing a plant having altered lignin content, composition and structure. They can be used for designing probes and primers useful for detecting similar DNA and RNA sequences in any organism and for PCR amplification. The lignin content can be efficiently modified using the polynucleotides. AAA67908 to AAA68201 and ABB16341 to AAB16449 represent polynucleotide and protein sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Local
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1171
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Match:

This cDNA sequence includes a coding region for the 320-amino acid shpx6 peroxidase (see AAW38217) of Stylosanthes humilis. A claimed method of engineering a plant to fungal resistance comprises introducing into cells of the plant a DNA construct comprising a promoter that is constitutively operative in the plant cell (preferably the cauliflower mosaic virus 35s promoter) and the shpx6 sequence, or a hybridising sequence or fragment that encodes an enzyme with peroxidase activity. Also claimed are plant cells harboring the DNA construct, a plant comprising such cells, and material from such a plant, especially seed, pollen, a stem segment

                  The present invention describes a set of peroxidase genes found in CC plants, especially rice, and their homologues, modified forms and CC fragments, where the sequences of the peroxidase genes in the set are CC given in AAH44071 to AAH44091. Also described are: (1) promoters for the CC control of the gene set; (2) the preparation of cassette vectors using CC the genes and promoters; (3) analysis of plant characteristics using the peroxidase set by isolating RNA from the plant, binding the RNA to a CC membrane, mixing with a labelled peroxidase gene set, incubating, and CC detecting the label signal to show which genes in the set are expressed. CC in the sample plant; and (4) DNA microarrays for peroxidase gene capression analysis. The set of genes are used for the analysis of the pattern of peroxidase gene expression in particular rice plants and CC their component tissues and under different environmental conditions, and modification of rice plants to provide desired specificaties of CC peroxidase gene expression to impart particular characteristics to the plants such as response to bacterial infection by Magnaporthe grisea.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δÃ

                                                                                          Pred.
                                                                                                       Alignment
                                                                                                                                                     The present invention describes a set of peroxidase genes found in plants, especially rice, and their homologues, modified forms and crawfill framents, where the sequences of the peroxidase genes in the set are given in AAH44071 to AAH44091. Also described are: (1) promoters for the control of the gene set; (2) the preparation of cassette vectors using the genes and promoters; (3) analysis of plant characteristics using the peroxidase set by isolating RNA from the plant, binding the RNA to a membrane, mixing with a labelled peroxidase gene set, incubating, and detecting the label signal to show which genes in the set are expressed in the sample plant; and (4) DNA microarrays for peroxidase gene capression analysis. The set of genes are used for the analysis of the pattern of peroxidase gene expression in particular rice plants and their component tissues and under different environmental conditions, and modification of rice plants to provide desired specificities of peroxidase gene expression to impart particular characteristics to the pants such as response to bacterial infection by Magnaporthe grisea.

The present invention describes isolated polynucleotides and proteins CC encoding and representing the enzymes cinnamate 4 -hydroxylase (C4H), CC coumarate 3 -hydroxylase (C3H), phenolase (PNL), 0-methyl transferase CC (OMT), cinnamyl alcohol dehydrogenase (CAD), cinnamyl-CoA reductase CC (CCR), phenylalanine ammonia-lyase (PAL), 4-coumarate:COA ligase (ACL), CC coniferol glucosyl transferase (CCT), coniferon beta-glucosidase (CBC), CC caffeic acid methyl transferase, caffeoyl COA methyl transferase, CCCT), coniferol oxidase, flavanol CC coumerate COA ligase, cytochrome P450 LXIA, diphenol oxidase, flavanol CC glucosyl transferase, flavenoid hydroxylase, and isoflavone reductase, CC composition and the structure of a plant, especially eucalyptus and pine CC composition and the structure of a plant, especially eucalyptus and pine CC species, and for modifying the activity of an enzyme involved in lignin CC ontent, composition and structure. They can be used for designing probes CC and primers useful for detecting similar DNA and RNA sequences in any CC organism and for PCR amplification. The lignin content can be efficiently CC modified using the polynucleotides. AAA67908 to AAA68201 and AAB16341 to CAAB16449 represent polynucleotide and protein sequences used in the CC exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel polynucleotide encoding enzymes involved in lignin-biosynthetic pathway useful for producing transgenic plants especially eucalyptus and pine species having altered lignin content, composition and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 1; Page 184; 213pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents the cDNA sequence of a peroxidase P7X gene. The P7X gene is isolated from maize inbred line Mp307. Peroxidases reduce hydrogen peroxide or molecular coxygen in the presence of an electron donor. Plant peroxidases are involved in pathogen defence responses. DNA constructs or transcription casse comprising peroxidase P7X gene and its promoter are useful for providing nematode resistance in plants.

The set of genes are used for the analysis of the pattern of peroxidase gene expression in particular rice plants and their component tissues and under different environmental conditions, and modification of rice plants to provide desired specificities of peroxidase gene expression to impart particular characteristics to the plants such as response to bacterial infection by Magnaporthe grisea.

The present invention describes isolated polynucleotides and proteins commarate 3-hydroxylase (C3H), phenolase (PNL), 0-methyl transferase (C(OMT), cinnamyl alcohol dehydrogenase (PNL), 0-methyl transferase (CC(OMT), cinnamyl alcohol dehydrogenase (CAD), cinnamyl-CoA reductase (CCR), phenylalanine ammonia-lyase (PAL), 4-coumarate:COA ligase (4CL), CC coniferol glucosyl transferase (CGT), coniferin beta-glucosidase (CBG), CC laccase, peroxidase, ferulate-5-hydroxylase (FSH), alpha-amylase, CC coumerate COA ligase, cytochrome p450 LXXIA, diphenol oxidase, flavanol CC glucosyl transferase, flavenoid hydroxylase, and isoflavone reductase, cytochrome p450 LXXIA, diphenol oxidase, flavanol CC glucosyl transferase, flavenoid hydroxylase, and isoflavone reductase, cytochrome p450 LXXIA, diphenol oxidase, flavanol CC glucosyl transferase, flavenoid hydroxylase, and isoflavone reductase, cytochrome p450 LXXIA, diphenol oxidase, flavanol CC content of the structure of a plant, especially eucalyptus and pine composition and the structure of a plant, especially eucalyptus and pine content, composition and structure. They can be used for designing probes and primers useful for detecting similar DNA and RNA sequences in any corganism and for PCR amplification. The lignin content can be efficiently corganism and for PCR amplification. The lignin content can be efficiently corganism and for PCR amplification. The lignin content can be efficiently corganism and for PCR amplification. The lignin content can be efficiently corganism and for PCR amplification. The lignin content can be efficiently corganism and for PCR amplification and structure. They can be used for designing probes and primers useful for detecting similar DNA and RNA sequences in any corganism and for PCR amplification. The lignin content can be efficiently exampled to AAB16341 to AAB16449 represent polynucleotides. AAB67908 to AAB68201 and AAB16341 to AAB16449 represent polynucleotides and primers used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is the nucleotide sequence of a maize per5 cDNA clone encoding root preferential cationic peroxidase (see AAW87893). The clone was isolated by screening maize root, stem, leaf, kernel and tassel RNA using probes (see AAV63718-19) based on tobacco peroxidase conserved domains. A probe generated from per5 cDNA was used to isolate the per5 gene (see AAV63717). Regulatory sequences of the per5 gene, including the promoter, introns and 3 untranslated region (3 UTR), arguession of recombinant gene cassettes for controlling expression of recombinant gene sh selected tissue, especially the root, of transformed plants, particularly maize.
